## Modeling (bio-)chemical reaction networks

(2) Sander Hille

Spring semester 2019

Metabolic Nw. An. L1b

Universiteit Leiden

## Biochemistry

### One aspect that distinguishes bio(logical) chemistry from general chemistry:

- The chemical compounds used by biological systems represent only a tiny fraction of all possible chemical carbon-based compounds with molecular mass in the same range:

estimated:  $\sim 10^3 - 10^4$  out of  $\sim 10^{60}$

(Ch.M. Dobson (2004). Chemical space and biology, *Nature* **432**, 824-828)

(3) Sander Hille

Spring semester 2019

Metabolic Nw. An. L1b

Universiteit Leiden

## Types of modelling

### What to model? Why? How?

- Be aware of purpose of mathematical modelling:  
What questions should be answered by the model and its *subsequent analysis and/or simulation?*

Determines the *type of model* used, *level of detail*, or 'complexity', of the model

(4) Sander Hille

Spring semester 2019

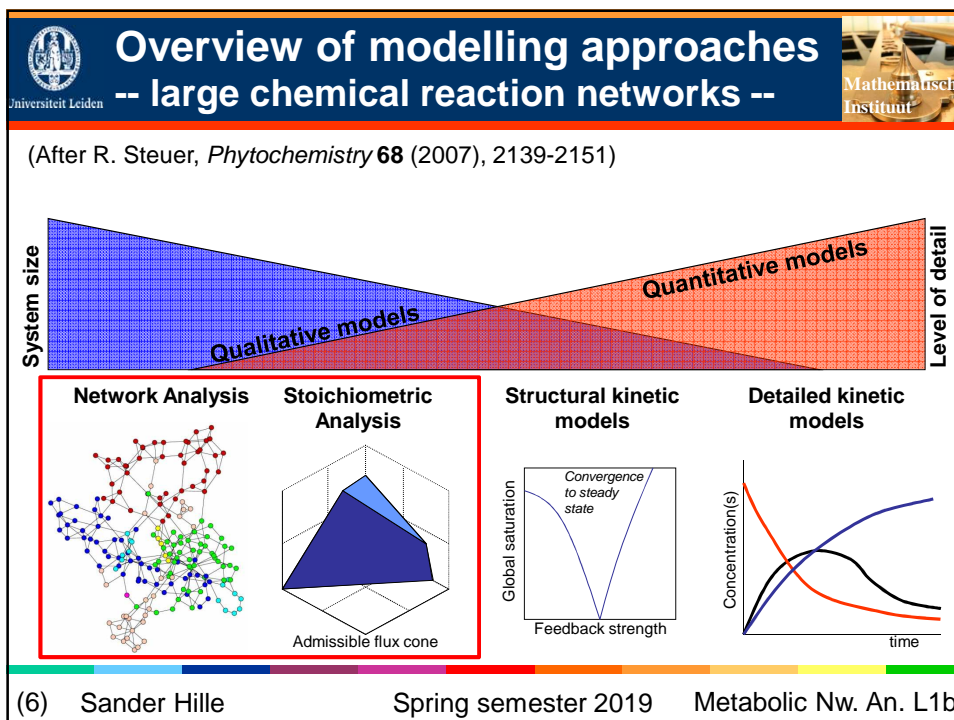

Metabolic Nw. An. L1b

Universiteit Leiden Mathematisch Instituut

## Types of modelling

	Qualitative	Quantitative
<i>our focus</i> →		
<b>Predictive</b>	<ul style="list-style-type: none"> <li>Fair level of realistic detail</li> <li>targeted at providing detailed <b>insight</b> in changes in behaviour or <b>optimal control</b></li> </ul>	<ul style="list-style-type: none"> <li><i>In silicon</i> version of reality</li> <li>used to <b>predict</b> development of a system with appropriate accuracy</li> <li>all relevant processes must be known in detail</li> </ul>
<b>Explorative</b>	<p>(‘Toy models’)</p> <ul style="list-style-type: none"> <li>(Highly) simplified system view</li> <li>targeted at <b>understanding</b> particular aspects of the system</li> </ul>	<ul style="list-style-type: none"> <li>Fair level of realistic detail</li> <li>targeted at <b>discovering</b> detailed realistic structure of the system</li> </ul>

Universiteit Leiden

## Levels of modelling -- defining a hierarchy --

A hierarchical organisation (of metabolism) has been defined *based on man-made concepts* in order to better understand functioning of metabolism

'traditional' hierarchy  
(found in most textbooks)

In contrast, graph theoretical results allow to introduce a *network-based hierarchy*.

'Network-based approach'

← *our focus*

Goal: to obtain an *unbiased* -- objective -- hierarchy in the system, derived (solely) from its intrinsic structure

(7) Sander Hille

Spring semester 2019

Metabolic Nw. An. L1b

Universiteit Leiden

## Metabolism

### Metabolism:

The set of chemical reactions that occur in living organisms in order to maintain life.

(8) Sander Hille

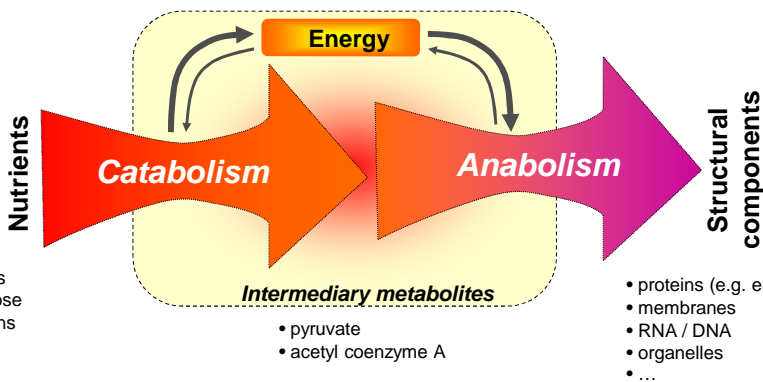

Spring semester 2019

Metabolic Nw. An. L1b

# Metabolism

**Metabolism:**  
The set of chemical reactions that occur in living organisms in order to maintain life.

- sugars
- cellulose
- proteins
- fats
- ...

- pyruvate
- acetyl coenzyme A

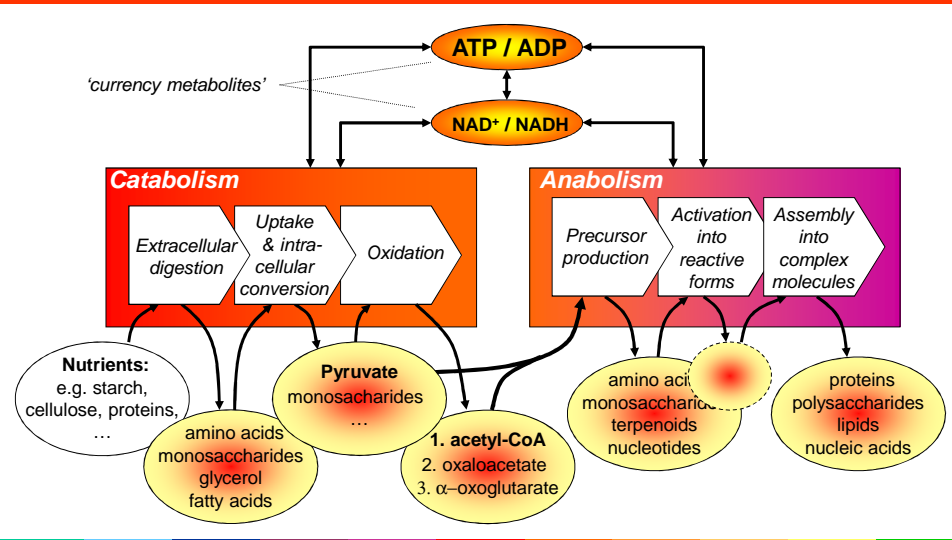

- proteins (e.g. enzymes)
- membranes
- RNA / DNA
- organelles
- ...

(9) Sander Hille      Spring semester 2019      Metabolic Nw. An. L1b

# Metabolism

-- detailed process view --

*'currency metabolites'*

**Catabolism**

Extracellular digestion → Uptake & intracellular conversion → Oxidation

**Anabolism**

Precursor production → Activation into reactive forms → Assembly into complex molecules

**Nutrients:** e.g. starch, cellulose, proteins, ...

**Pyruvate** monosaccharides ...

**1. acetyl-CoA**  
2. oxaloacetate  
3. α-oxoglutarate

amino acids, monosaccharides, glycerol, fatty acids

amino acids, monosaccharides, terpenoids, nucleotides

proteins, polysaccharides, lipids, nucleic acids

(10) Sander Hille      Spring semester 2019      Metabolic Nw. An. L1b

Universiteit Leiden

# Metabolism

## -- Currency metabolites --

### ADP / ATP:

*Adenosine Di-(Tri-)Phosphate*

**Function:** Transport of energy within cells  
e.g. for metabolism; phosphate donor

### NAD<sup>+</sup> / NADH:

*Nicotinamide Adenosine Dinucleotide*

**Function:** Transfer of electrons from one compound to another in redox reactions

**NAD<sup>+</sup>:** oxidizing agent, accepts electrons

**NADH:** reducing agent, donates electrons

(11) Sander Hille

Spring semester 2019

Metabolic Nw. An. L1b

Universiteit Leiden

# Metabolism

## -- Reduction and oxidation of NAD<sup>+</sup>/NADH --

**Oxidation:** the loss of electrons by a molecule, atom or ion

**Reduction:** the gain of electrons by a molecule, atom or ion

# Metabolic networks -- some characteristics --

- **Almost all reactions are catalyzed by enzymes**

Example of an enzyme

Crystal structure of hexokinase

- **Some reactions do not (hardly) occur in their absence**

Although chemically:  
**Principle of microscopic reversibility**

- **Large number of (substrate) molecules**

# Chemical reaction networks viewed as mathematical graphs

Universiteit Leiden

# Graph representations

-- some basic mathematical terminology --

An **undirected graph**  $G$  is an ordered pair  $(V,E)$  of a finite collection of **vertices**  $V$  (or 'nodes') together with a set  $E$  of two-point subsets of  $V$ , the **edges** (or 'lines').

Other examples:

Complete graphs

Disconnected graph

Graphs with cycle and with self-loops

(21) Sander Hille

Spring semester 2019

Metabolic Nw. An. L1b

Universiteit Leiden

# Graph representations

-- some basic mathematical terminology --

A graph  $G=(V,E)$  can be represented by a matrix, the **adjacency matrix** of  $G$ , in the following manner:

1. Label the vertices by natural numbers  $1,2, \dots, n$
2. The adjacency matrix is the  $n \times n$  matrix with coefficients

$$a_{ij} = \begin{cases} 1, & \text{when } \{i,j\} \in E \\ 0, & \text{otherwise.} \end{cases}$$

Example:

(22) Sander Hille

Spring semester 2019

Metabolic Nw. An. L1b

Universiteit Leiden

# Graph representations

-- some basic mathematical terminology --

A **bipartite graph** is a graph  $G=(V,E)$  such that the set of vertices is the disjoint union of two subsets  $V_1$  and  $V_2$ , such that there are no edges connecting vertices within each of these subsets.

A bipartite graph

In a bipartite graph the vertices can be coloured in such a way that no two vertices of the same colour are connected through an edge.

(23) Sander Hille

Spring semester 2019

Metabolic Nw. An. L1b

Universiteit Leiden

# Graph representations

-- some basic mathematical terminology --

A **bipartite graph** is a graph  $G=(V,E)$  such that the set of vertices is the disjoint union of two subsets  $V_1$  and  $V_2$ , such that there are no edges connecting vertices within each of these subsets.

Not a bipartite graph

(24) Sander Hille

Spring semester 2019

Metabolic Nw. An. L1b

Universiteit Leiden

# Graph representations

-- some basic mathematical terminology --

A **directed graph**  $G$  is an ordered pair  $(V,A)$  of a collection of **vertices**  $V$  (or 'nodes') together with a set  $A \subset V \times V$  of ordered pairs of vertices, called **arrows** (or 'directed edges', 'arcs').

A **path** of length  $n$  from  $v_0 \in V$  to  $v_1 \in V$  is a sequence of arrows in  $A$ ,  $a_1, \dots, a_n$  such that  $a_1$  starts in  $v_0$ ,  $a_n$  ends in  $v_1$  and the end point of  $a_i$  is the starting point of  $a_{i+1}$ .

(25) Sander Hille

Spring semester 2019

Metabolic Nw. An. L1b

Universiteit Leiden

# Graph representations

-- some basic mathematical terminology --

An adjacency matrix can be defined for a directed graph  $G=(V,A)$  similarly to that for an undirected graph:

- The adjacency matrix of a directed graph with  $n$  vertices is the  $n \times n$  matrix with coefficients

$$a_{ij} = \begin{cases} 1, & \text{when } (i,j) \in A \\ 0, & \text{otherwise.} \end{cases}$$

Example:

(26) Sander Hille

Spring semester 2019

Metabolic Nw. An. L1b

Universiteit Leiden

# Graph representations

-- some basic mathematical terminology --

The concept of a bipartite graph can be applied to directed graphs also...

	1	2	3	4	5	6	7
1						1	0
2						1	0
3						0	1
4						0	1
5						0	0
6	0	0	1	1	0		
7	0	0	0	0	1		0

	6	7
1	-1	0
2	-1	0
3	1	-1
4	1	-1
5	0	1

- Directed bipartite graphs have a specially structured adjacency matrix...
- Hence may be coded more efficiently ...

(27) Sander Hille

Spring semester 2019

Metabolic Nw. An. L1b

Universiteit Leiden

# Graph representations of chemical reaction networks

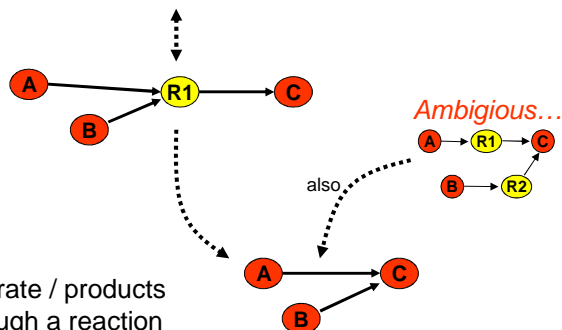

Bipartite directed graphs can be used to model chemical reaction networks:

Chemical reaction:  
(unidirectional)

Bipartite graph:  
(directed graph)

- Substrate / product
- Chemical reaction

Substrate graph:  
(directed graph)

Arrow between substrate / products when connected through a reaction

(28) Sander Hille

Spring semester 2019

Metabolic Nw. An. L1b

Universiteit Leiden

# Graph representations of chemical reaction networks

Ambiguity in substrate graphs may be circumvented by using *hypergraph* notation...

(29) Sander Hille

Spring semester 2019

Metabolic Nw. An. L1b

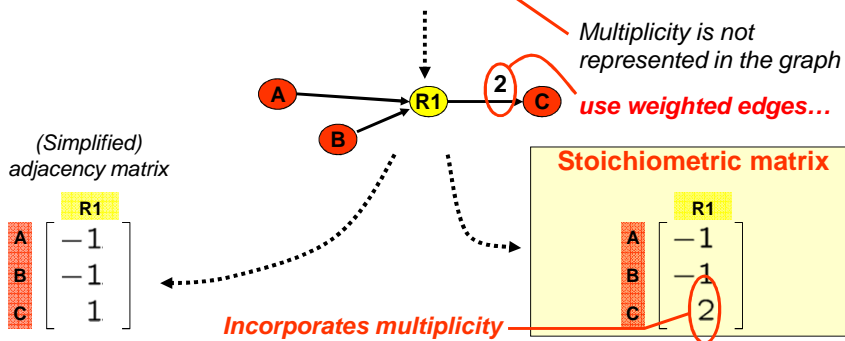

Universiteit Leiden

# Graph representations of chemical reaction networks

Another ambiguity is present even in bipartite graphs associated to chemical reactions...

Chemical reaction:  
(unidirectional)

(30) Sander Hille

Spring semester 2019

Metabolic Nw. An. L1b

Universiteit Leiden

# Graph representations of chemical reaction networks

Multiple chemical reactions:  
(unidirectional)

Bipartite graph:

Reaction graph:

Arrow from a reaction to another when the endpoint uses a product of the first as a substrate

(31) Sander Hille

Spring semester 2019

Metabolic Nw. An. L1b

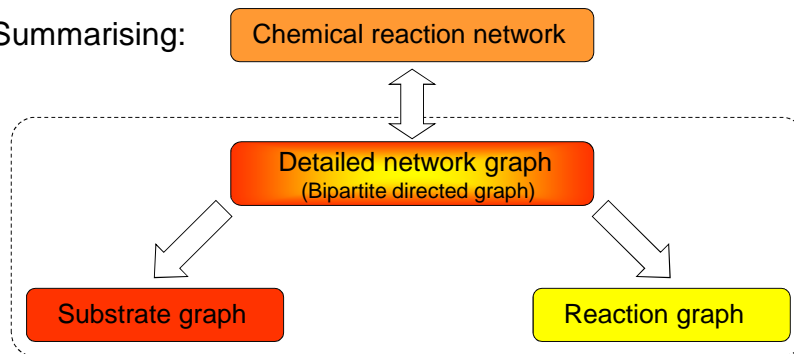

Universiteit Leiden

# Network Analysis

Summarising:

May use nodes of different shapes instead of colours to distinguish compounds from reaction:

(32) Sander Hille

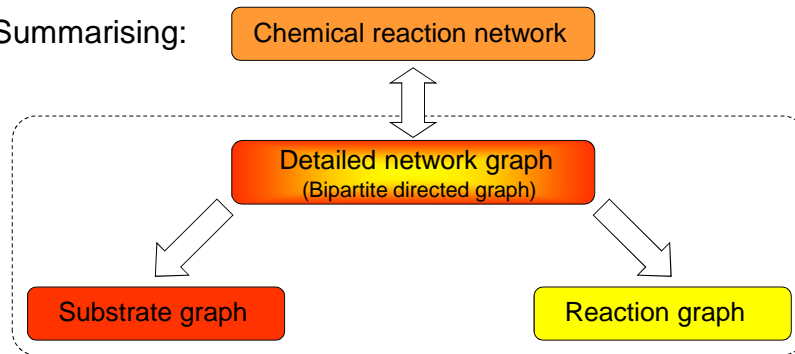

Spring semester 2019

Metabolic Nw. An. L1b

Summarising:

**Network Analysis** is the term used in the literature for studying the properties of these graphs.

*'Network statistics'*
